Qty	Description
1	Control Station
4	1/4 by 1/2 carriage bolts (Post mount units only)
4	1/4-20 hex nuts (Post mount units only)
1	Square mounting flange (Post mount units only)

If any of the above items are missing from this box, contact American Access Systems

TOOLS YOU WILL NEED

Wire nuts or appropriate connectors

Wire strippers

Wire cutters

3/8" drive ratchet with 6" extension and 7/16" socket (Post mount units only)

Digital or Analog multi-meter

BEFORE PROCEEDING

To take full advantage of the 24 month limited warranty, you must be registered with American Access Systems, Inc. Please read the enclosed warranty statement, (pg 2), fill out the warranty registration card provided, and send it to:

American Access Systems, Inc. Warranty Registration 7079 South Jordan Road /Unit 6 Englewood, Co. 80112

INTRODUCTION

Your new ADV unit is a high quality, commercial grade, programmable digital key control station. The unit incorporates a single relay with a normally open and normally closed output. The ADV 100m is housed in a 16 guage steel enclosure with a powder coat finish for durability and also includes a membrane keypad. Please be sure to read and understand all instructions before proceeding with the hookup and programming instructions.

MASTER CODE

STEP 1-MOUNTING THE UNIT

Page 3 tells you what tools and instruments you will need to install your unit and presents a parts check list. Make sure to have all the tools listed. Upon opening the box, check off the items enclosed with the unit. It any items are missing from your unit, contact American Access Systems immediately.

Mounting the unit to your own pedestal

Your unit comes with a square mounting flange found in the bottom of the box along with four carriage bolts and four hex nuts. The square mounting flange may be welded to your pedestal and the flange bolt pattern will align with the back of the unit. Place the unit up to the flange and insert the carriage bolts from the back side. Secure the unit to the flange by tightening down the hack nuts with a 7/16" socket.

Mounting the unit to an AAS gooseneck (18-001) or double height (18-003)pedestal

Locate the four carriage bolts and four hex nuts found inside the unit box. Place the unit to the pedestal than ge and insert the four carriage bolts from the backside. Secure the unit to the pedestal using the four hex nuts and a 7/16" socket. The extra square mounting flange may be discarded.

Mounting the unit to an AAS diagonal pedestal (18-002)

Locate the four bolts provided with the pedestal. Place the unit up to the pedestal so that the unit hole pattern aligns with the pre-tapped pedestal bolt holes. Insert the pedestal bolts from the inside of the unit and tighten down with a 7/16" socket. The extra square mounting flange, four carriage bolts, and four hex nuts provided inside the unit box may be discarded.

SLED 7-SASLEM CONNECTIONS
18-001
18-003

Study the WIRING COLOR CODE chart below and then proceed to the hookup steps.

HOOKUP STEPS

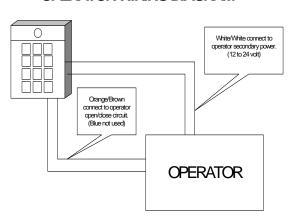

(A). Your DKLP control unit operates on 12 to 24 volts AC or DC. Measure the voltage from the power source to make sure it falls within these tolerances. Locate the two white wires on the circuit board and with the power off connect them to a constant power supply.

₽ ə8vd

30-023 Board Layout

OPERATOR WIRING DIAGRAM

- **(B).** Connect the device to be controlled to the appropriate control leads of the 26-100 (See above diagram).
- (C). Double Check your connections. When you are sure that everything is hooked up correctly, apply power to the unit. A BEEP should be heard when you press a key on the keypad.

THE MASTER CODE AND ACCESS CODES

Your unit may be programmed with 100 multiple (4 digit) ACCESS CODES. The MASTER CODE is a 4 digit programmable code used for accessing the program mode. Note: The model number of the unit is located on the inside face of the unit. Note: The Master Code will not activate the relay!

SETTING OR RESETTING THE MASTER CODE

To set or reset the master code back to the **factory default of 1 2 5 1** should you ever loose or forget you master code. To do this follow these steps: (SEE PAGE 7 FOR LOCATION DIAGRAM)

- (1). Disconnect power from the unit by disconnecting power from circuit board.
- (2). Reconnect power while holding down the PROGRAM/RESET button.
- (3). A single keybeep will be heard from the unit indicating that the master has been reset

GOODBEEPS AND ERRORBEEPS

A standard beep will be heard each time a key is pressed. A "GOODBEEP" is represented by a series of quick beeps in succession. An "ERRORBEEP" is represented by a single long beep.

THE IDLE MODE

The idle mode is the normal mode of operation. When in this mode the unit sits and waits for data from the keypad. If a key is pressed from the keypad, you will have approximately 3 seconds between each keypress before the unit resets.

THE PROGRAM MODE

The program mode is the mode of operation in which you will enter/change your access code. Upon entry, a GOODBEEP will heard. A GOODBEEP will also be heard when you exit the program mode unless a keypress timeout occurs in which case you will receive an ERRORBEEP. The program mode is accessed by entering the "MASTER CODE" from the keypad. If the master code is valid, you will receive a GOODBEEP from the unit. In this mode you will have approximately 15 seconds between keypresses. If this time is exceeded, you will receive an ERRORBEEP and the unit will exit the program mode and return to the idle mode. To exit the program mode at any time, press #.

THE * AND # KEYS

The * and # keys serve specific functions while in the idle or program mode. The * key is always the clear key. You should use this key if you make an entry error. The # key also serves as the clear key in the idle mode. In the program mode however, it serves as the exit key and will at any time when depressed, exit you from the program mode.

when you enter "0", the output time is set to 1/2 seconds.

Sub-Mode 5 (Set Latch Code)

able to assist you if you have any specific questions. entered, your operator is not set up to utilize this function. Your local dealer or distributor should be circuit must exist in the operator in order to utilize this function. If your gate cycles when this code is be overridden by the latched state of the relay and the gate will hold open. An "OPEN-OVERRIDE" gate is desired to hold open. If the operator's close circuit is controlled by loops, timers, etc., they will LED will light if the relay is in the latched position. The latch code is useful in applications where the EXPLANATION: The Latch Code toggles the state of the main relay (A) of the circuit board. The red
