

CEDAR AND REDWOOD CARE FOR PRODUCT MADE BY NANTUCKET POST CAP

Your Western Red Cedar and Redwood items must be treated prior to being installed.

Treat the entire cap, top, bottom, all sides, inside and out! Apply a thin coat and wipe off excess with a rag.

Repeat this process at least one more time after first coat is completely dry.

The following products are recommended:

- Exterior Urethane
- Exterior Stain
- Exterior Paint

Our products will **NOT BE COVERED UNDER WARRANTY** if they are **NOT** treated prior to being installed.

Please note that it is very common for fences to be installed where the wood is wet, or “green”, in which case you need to wait for the materials to dry out before treating the wood. Our post caps are kiln dried meaning that they are completely dry, and don’t require time to dry out. It is extremely important to treat the caps before they are installed outdoors. If the caps are left untreated they will most likely crack due to the sun exposure without proper protection.

We also recommend predrilling the caps and using a small finish screw to attach them to the posts. This allows for easy removal if the cap ever needs replaced.

Thank you,

Nantucket Post Cap
